

Playwright MCP guidance

This file documents how to run Playwright-based end-to-end tests for the repository and how an MCP server should be configured.

Recommended MCP server role: “playwright” — a server that can run Playwright scripts (Chromium) against a local or deployed instance of the site.

Example commands (local):

- Install dependencies: `python -m pip install -upgrade pip pytest requests playwright playwright install --with-deps`
- Run tests (server must be running on port 8080): `python src/public_html/server.py & pytest -q e2e`

CI notes: - The provided `.github/workflows/e2e.yml` starts the server in the background in CI, installs Playwright, and runs the e2e/test suite. - MCP server should expose an agent that can execute the same commands and return test traces/artifacts.

MCP integration checklist: - Ensure the agent image includes Python 3.10+ and the Playwright Python package. - Provide `playwright install --with-deps` as part of setup. - Provide network access between the agent and the service under test (localhost or an exposed URL). - Capture artifacts (screenshots, page HTML) on failure for debugging.
