

Ship tokens by Samuel Penn. Licensed CC0. See <https://gitlab.com/samuelpenn/spacecraft-dungeondraft>

Tokens are sized according to ship tonnage. They are 256px per square, and designed to fit onto the following square sizes:

Squares	Tonnage	Pixels
1x1	<30t	256
2x2	30t - 99t	512
3x3	100t - 299t	768
4x4	300t - 999t	1,024
5x5	1,000t+	1,280
6x6	3,000t+	1,536
7x7	10,000t+	1,792
8x8	30,000t+	2,048
9x9	100,000t+	2,304
10x10	300,000t+	2,560

They don't have to be given these sizes, but it does give a consistent scaling across ship sizes, with most ships being a reasonable size. The odd big ship will still stand out though as something special.
