

Batch OCR Counter Extraction

This script automates the process of scanning all PDFs in a directory for 200x100px counter images, running the ocr-pic skill on each relevant page, and saving the OCR results to separate text files. Pages without such counters are ignored.

Usage

```
python batch_ocr_counters.py [input_dir] [output_dir]
```

- `input_dir`: Directory containing PDF files (default: PDFs)
- `output_dir`: Directory to save OCR results (default: OCR)

Requirements

- Python packages: pypdf, Pillow, pytesseract, numpy
- System: tesseract-ocr
- `ocr-pic.py` script (from ocr-pic skill) must be present in the same directory or in your PATH

How it Works

- For each PDF in the input directory:
 - Each page is checked for embedded images of exactly 200x100px.
 - If such images are found, the page is processed with `ocr-pic.py`.
 - OCR results are saved as `<pdf_stem>-page<N>.txt` in the output directory.
 - Pages without counters are skipped.

Example

```
python batch_ocr_counters.py PDFs/ OCR/
```

This will process all PDFs in the PDFs/ directory and write OCR results to OCR/.

See `ocr-pic.py` and the ocr-pic skill documentation for details on counter structure and output format.
