

Mongoose Traveller for FoundryVTT

Version: 0.19.0

This is an implementation of Mongoose Traveller 2e for FoundryVTT. It currently supports Foundry v13.

It is currently in beta, so suggestions and bug reports are greatly appreciated. The basic game rules are currently supported, but new features are being added all the time.

Mongoose Traveller on Foundry

Currently, it provides support for: * Character sheets for Travellers (PCs), NPCs, Spacecraft, Worlds and Creatures are provided. * A full built-in list of skills for characters, along with Mongoose 2e rules for specialities and professions. * Skills can be dragged to the hot bar for quick access. * Attack rolls, with damage and effect, stun damage, AP and other weapon attributes. * Augments, including Expert Systems, augmented armour and cyberwear. * Support for background and alien race packages. * Career terms for character generation, including allies, contacts and enemies. * Basic support for spacecraft, and combat between spacecraft. * The Speculative Trade, Freight and Passenger rules are implemented for Worlds.

Note that it does not currently include 'content' such as equipment lists.

How to Build

Compendium Packs

Objects in compendium packs are stored as individual JSON files. * Use `mkpacks pack` to convert from JSON to binary DB format. * Use `mkpacks unpack` to convert from binary DB format to JSON.

These scripts assume that the foundry CLI `fvtt` is present and configured. The `dataPath` should be set to the local `mgt2` directory.

e.g.

```
fvtt configure set dataPath $PWD/mgt2e/
```

Releases

Use `release.sh` to create a release file. One of the following options must be used: * `-s` Keep the version the same * `-p` Increment the

patch release version (0.1.2 becomes 0.1.3) * -m Increment the minor release version (0.1.2 becomes 0.2.0) * -M Increment the major release version (0.1.2 becomes 1.0.0)

You can also add -b which will create a new Git branch based on the new version number, ready for branching a release.

A release runs `mkpacks unpack` followed by `mkpacks pack`, so it is recommended that compendiums are locked and Foundry is shutdown when this is done. If not, changes in the Foundry database may be lost.

Use `mkpacks unpack` to export compendium packs from Foundry into source files. This *must* be run when the compendium packs are locked and Foundry has been closed down. If this is not the case, then new changes to the packs will not be exported.

Use `mkpacks pack` to import compendium packs from source files into Foundry. This will overwrite anything in the Foundry database files with what is in the source files.

Object Types

The main supported object types defined in the system are:

Actors

- Traveller - A player character
- NPC - Cut down version of a Traveller
- Creature - Creatures with even fewer details
- Spacecraft - A spacecraft.
- Vehicle - Preliminary support for a basic sheet.
- Worlds - Defines worlds, and implements some of the trade rules.
- Package - Contains package of skills, items and attributes for building NPCs or Travellers from.

Items

- General Item - Normal equipment without special rules.
- Weapon - Weapons, used by people and creatures.
- Armour - Armour, used by people and creatures.
- Augmentation - Expert Systems, Augments and other things that provide bonuses
- Career Term - Represents a Term during character creation.
- Associate - Represents a contact, ally, enemy or rival gained during character creation.
- Cargo - Goods to be bought and sold, carried on spacecraft.

- Spacecraft Hardware - Items a spacecraft is built from.
- Crew Roles - Specify roles for crew members of a starship or vehicle.
- Software - Designed to run on computers.
