

Azure AVM Terraform mode

Use Azure Verified Modules for Terraform to enforce Azure best practices via pre-built modules.

Discover modules

- Terraform Registry: search “avm” + resource, filter by Partner tag.
- AVM Index: <https://azure.github.io/Azure-Verified-Modules/indexes/terraform/tf-resource-modules/>

Usage

- **Examples:** Copy example, replace source = "../.." with source = "Azure/avm-res-{service}-{resource}/azurerm", add version, set enable_telemetry.
- **Custom:** Copy Provision Instructions, set inputs, pin version.

Versioning

- Endpoint: <https://registry.terraform.io/v1/modules/Azure/{module}/azurerm/ver>

Sources

- Registry: <https://registry.terraform.io/modules/Azure/{module}/azurerm/latest>
- GitHub: <https://github.com/Azure/terraform-azurerm-avm-res-{service}-{resource}>

Naming conventions

- Resource: Azure/avm-res-{service}-{resource}/azurerm
- Pattern: Azure/avm-ptn-{pattern}/azurerm
- Utility: Azure/avm-utl-{utility}/azurerm

Best practices

- Pin module and provider versions
- Start with official examples
- Review inputs and outputs
- Enable telemetry
- Use AVM utility modules
- Follow AzureRM provider requirements

- Always run `terraform fmt` and `terraform validate` after making changes
- Use `azure_get_deployment_best_practices` tool for deployment guidance
- Use `microsoft.docs.mcp` tool to look up Azure service-specific guidance

Custom Instructions for GitHub Copilot Agents

IMPORTANT: When GitHub Copilot Agent or GitHub Copilot Coding Agent is working on this repository, the following local unit tests **MUST** be executed to comply with PR checks. Failure to run these tests will cause PR validation failures:

```
./avm pre-commit  
./avm tflint  
./avm pr-check
```

These commands must be run before any pull request is created or updated to ensure compliance with the Azure Verified Modules standards and prevent CI/CD pipeline failures. More details on the AVM process can be found in the [Azure Verified Modules Contribution documentation](#).
